Title : On the Participation of the Central Nervous System in Thyrotropic Reaction of Hypophysis.

Orig Pub : Commun. Acad. R.R., 1955, 5, No 2, 425-432

Abstract : After preliminary introduction (PI) in rats in the course of 12 days of methylthiouracil or caffeine (I), as well as luminal, the content of thyrotropic hormone (TH) was increased in hypophysis. (I) increased the content of TH and after PI of thyroiodine the specific action of the latter dropped; after PI of iodine, I decreased the content of TH. Chloralose caused a decrease of the content of TH both after PI of methylthiouracil and after (I), lowering the influence of iodine and contributing to the decrease of the content of TH, because of thyroiodine.

percent. After epiphysectomy, AHL and PHL MA were of the same magnitude. In guinea pigs, Ma of PHL and AHL is of the same magnitude, yet it is less marked than Ma of hypothalamus tissue. Thiouracil modifies MA of the hypothalamus considerably, but does not affect PHL activity. Thus, PHL contains more substances capable of producing Ma (thyrotropin?). Such substances are often found to be present in PHL in the same concentrations as in AHL or in the hypothalamus. The nature of these substances has not been established as yet. -- S.E. Gol'dmakher

and eosinophiles are counted. The test is considered to be sharply positive if eosinopenia reaches 50 percent or lower of the initial level. In adrenal insufficiency (AI), the test is sharply positive in only three cases out of 30; in all others eosinopenia was absent but leucocytosis, neutrophilia, and lymphopenia were noted. In treatment of AI, according to clinical improvement, a positive test appears or increases. In hyperfunction of the adrenals (52 patients) a sharply positive test is noted in only 13.4 percent of the cases. In hyperthyroidism (52 patients) eosinopenia, leucocytosis, neutrophilia, and lymphopenia are sharply expressed in an overwhelming number of cases. In hyperthyroidism the test is weakly positive. The testing of

Title : The Presence of Metamorphogenic Substances in the Hypothalamus

Orig Pub : Studii si cercetari endocrinol. Acad. RPR, 1956, 7, No 3,
404-409

Abstract : Pieces (2mg) of the anterior lobe of the pituitary, of the hypothalamus and of frontal lobe cerebral cortex from adult guinea pigs were transplanted into tadpoles. Some of the guinea pigs had received 20 mg of methylthiouracil with their food for a period of 12 days. The tadpoles were autopsied after 10 days. The shortening of the intestine served as an index of metamorphogenic activity. The hypothalamus possesses evident metamorphogenic activity, shortening the intestine by approximately 35%. The hypophysis shortened the intestine by 7%, the cortex by 12%.

In rats breathing oxygen-enriched air the oxygen consumption is increased, the reticulocyte count lowered and the thyrotrophin content of the pituitary increased. In oxygen-poor air all these phenomena are reversed. Treatment with methylthiouracil under similar conditions produces changes in metamorphogenic activity of the pituitary and thyroid which point to a modification of thyrotrophin action. In rats in which such treatment had caused a massive decrease in the reticulocyte count, exposure to oxygen-enriched or oxygen-deficient air no longer had any effect on the number of reticulocytes. Attention is drawn to the correlations existing between the thyroid, the lung and the erythrocytes with respect to the maintenance of homeostasis of oxidative processes.

TITLE : The Effect of Water Oxidation upon
Metamorphosis of Tadpoles.
CRIG. PUB. : Studii si cercetari endocrinol. Acad. RPR.,
1957, 8, No 2, 237-239
ABSTRACT : Tadpoles which were kept in water hyperoxidized
by stirring, displayed an inhibition of meta-
morphosis to the same degree as when they were
subjected to the effect of methylthiouracil, but
this chemical agent's effect is not identical
with the former. It is possible that the excess
of O₂ produces an inhibitory effect upon the
activity of the tadpole's thyroid. An analogous
inhibitory effect is produced by stagnant water
as well. Apparently, the thyroid gland which

SOURCE: Meres es automatika, v. 13, no. 8, 1965, 233-235

TOPIC TAGS: titrimetry, selenium rectifier, electric transformer, voltmeter, electron tube

ABSTRACT: A relatively simple, yet accurate (to within ± 1 relative %) oscilloscope for high-frequency titration purposes, capable of being assembled from generally available components, was described. The principal components of the device include a selenium rectifier, a transformer, four electronic tubes, an adjustable condenser, titration cell, and vacuum-tube voltmeter. If the voltmeter has a recorder output, the device can be used for recording. The construction, operation, performance, and applications of the device were described and illustrated with schematic diagrams and drawings. It can be modified for measuring frequency differences. TITLE: Derivatives of <u>phosphorylated polypropylene</u>	1 66 65
SOURCE: Chemicke zvesti, no. 5, 1963, 318-329	
TOPIC TAGS: polypropylene chlorophosphorylation, polypropylene, hydrophobic cellulose	6
ABSTRACT: The authors studied the reaction between <u>polypropylene</u> and PCl sub 3 and oxygen during which chlorophosphorylation of polypropylene took place. Groups -POCl sub 2 were introduced into the molecule of polypropylene to prepare various derivatives. Atactic polypropylene was dissolved in PCl sub 3 and by the action of oxygen, chlorophosphorylation took place. Isotactic material such as threads and films was chlorophosphorylated by absorbing PCl sub 3 on the surface and acting upon it with oxygen. By the action of water, alcohols, or amines, respective polymers of esters and amides of alkylphosphonic acid were obtained. Their properties varied according to phosphorus content. Cellulosic

materials subjected to the action of chlorophosphorylated atactic polypropylene acquire an hydrophobic character. Dichlorophosphonic groups that were accumulated in the surface layer of filament-type polypropylene material were used for a direct condensation with hydroxy- or aminogroups of some thermal oxidizing or light stabilizers. It was found that these compounds imparted thermal and light stabilization properties even to materials that did not possess such properties before they were combined with the modified polypropylenes. TOPIC TAGS: impurity concentration, germanium diffusion layer, silicon diffusion
layer, impurity center, diffusion layer, differential conductivity, ionization,
acceptor ionization, double diffusion layer

ABSTRACT: A method is described for the direct measurement of the distribution of
impurities in Ge and Si diffusion layers based on the measurement of the differen-
tial conductivity. This approach is often necessary in practice when it is re-
quired to plot the most complicated curve forms of the distribution concentration
of active impurities in a diffusion layer. The suitability of this measurement
method for various types of diffusion layers encountered in technical practice is
discussed. The physical principle of the method is a knowledge of the differen-
tial conductivity, the concentration of acceptors, and the degree of ionization
of the acceptors which makes it possible to determine the average concentration of

Card 1/2

L 16602-65
ACCESSION NR: AP4041661

donors in the layers being measured. The great advantage of the method described is that it makes it possible to determine the course of any impurity concentration curve in diffusion layers in a laboratory in which the equipment is not of too high specifications. At the same time accuracy of determination is relatively high if the principles stated in the article are followed. Expressions are given for calculating the measurement error due to the inhomogeneous state of the layer. The method described can be used to determine the concentration in double diffusion layers when there is a difference of impurity concentration gradient at the boundary of both types of conductivity. An example is given of the measured concentration curve in a double diffusion layer on silicon formed by the diffusion of gallium and phosphorus. Calculation corrections to be made in the case where the semiconductor being measured is frequency compensated are discussed. Orig. art. has 8 diagrams and 10 formulas.

925. Theory of Motion of Electrons in Crossed Electric and Magnetic Fields with Space Charge. S. V. Bettiola. *Phys. Zeits. d. Sowjetunion*, 10, 2, pp. 251-264, 1936. In English.—The solution of this problem for a plane condenser given by Braude [see Abstract 4412 (1936)] was criticised by Tonks [see Abstract 1378 (1936)]. It is here shown that the conclusions reached by Braude in examining the case of plane electrodes result from an assumption implied in his initial equations and can be claimed to have physical meaning only on so far as the equations in question remain valid. The revision of Braude's investigation removes the objections raised by Tonks and makes the conclusions reached by Braude acceptable, both mathematically and physically. The arguments applied to the case of plane electrodes apply to a certain extent to the case of cylindrical electrodes [see Abstract 1389 (1936)]. Braude's representation of the return path of an electron is, however, incorrect. The shape of the return path should be symmetrical with respect to the direct motion branch. Note by S. J. Braude, *Ibid.* 10, 3, pp. 422-430, 1936. A. W.

TITLE:

Capacity in stationary charge distribution between electrodes

PERIODICAL: Radiotekhnika i elektronika, v. 7, no. 3, 1962,
491 - 498

TEXT: The definitions of capacity in the presence of space charge proposed by various authors are critically discussed showing that they are based upon relations no longer true for space charge and inadequate from the point of view of the external circuit. The author investigates the question of capacity in the presence of space charge under the simplifying assumption of infinitely slow variations of the conditions (e.g. infinitely low frequency of oscillation). The generalized definition of capacity is introduced by considering an equivalent system of the interelectrode gap independent of the properties of the medium; the only restriction is the requirement that the changes should be quasistationary, so that the charge density is described by the Poisson equation. The 'effective' Card 1/2 X

Capacity in stationary charge dis- ... S/109/62/007/003/017/029

differential capacity of the interelectrode gap' is formulated as
 $C = \frac{1}{i_1 + i_2} (i_1 \frac{dQ_2}{dU} - i_2 \frac{dQ_1}{dU})$ where subscripts 1 and 2 designate each of the two electrodes, i_1 and i_2 are currents flowing on electrode 1 and 2 respectively, Q_1 and Q_2 being the respective charges of the electrodes. The general definition is applied as an example to a few particular cases. It is observed that the introduced definition implies a dependence of the capacity upon the character of the relation between the field at the electrodes and the potential difference. TITLE: Capacity of a plane diode with space charge and Maxwellian distribution of the initial velocities of the electrons

PERIODICAL: Radiotekhnika i elektronika, v.7, no. 3, 1962,
 499 - 508

TEXT: The purpose of the paper is to determine the capacity of a plane diode in the presence of a stationary current and taking account of the distribution of initial velocities. The dimensions of the parallel plates are assumed to be large enough for neglecting edge effects and small enough for neglecting the effect of the magnetic self field on the electron motion. The expression for the capacity, taken from another paper of Bellyustin (Ref. 2: Radiotekhnika i elektronika, 1962, 7, 3, 491) reads as follows:

$$C = \frac{S}{4\pi} \left\{ \frac{i_a}{I_s} \frac{d}{d\Phi_a} \left(\frac{d\Phi}{dx} \right)_a + \frac{i_s - i_a}{I_s} \frac{d}{d\Phi_a} \left(\frac{d\Phi}{dx} \right)_a \right\}, \quad (1)$$

Card 1/3

S/109/62/007/003/018/029
D266/D302

Capacity of a plane diode with ...

where S - area of the electrodes, j_a - anode current density, j_s - emission current density, $\Phi = e_0 \varphi / kT$, e_0 - absolute value of the charge of an electron, φ - potential in respect to the cathode, k - Boltzmann constant, T - absolute temperature of the cathode, the indices a and o refer to the anode and cathode respectively. The potential in the diode is calculated by using V. Bursian's and I. Langmuir's approach. The authors employ a dimensionless parameter

$$\alpha = 2d \sqrt[4]{\frac{2\pi m e^2 j_s^2}{k^3 T^3}}$$

to characterize the flow, and calculate the capacity for the regions of I) saturation current, II) space-charge limited, III) retarding anode voltage. The ratio of 'hot' capacity is plotted as a function of anode voltage for $\alpha = 3$ (weak emission) and $\alpha = 200$ (strong emission). In both cases the maxima are on the boundary of the space-charge limited and temperature limited regions. The capacity is always positive and generally exceeds the 'cold' capacity. In the space-charge limited region the capacity appreciably differs

D266/D302

from the value $(4/3)C_0$, which is obtained (Ref. 2: Op.cit.) by neglecting initial velocities. The numerical results, calculated by the authors, do not agree with those of A. van der Ziel, who used a different formula for the capacity. There are 4 figures and 17 references: 5 Soviet-bloc and 12 non-Soviet-bloc. The 4 most recent references to the English-language publications read as follows: W.F. Lovering, S.C. Bull, Proc. Instn.
